

Module Five and Six Research Questions

Scope creep occurs when a project's scope begins expanding past what had been planned initially. For the example I've chosen is one of the classic examples, being the baggage system for the Denver International Airport. What began as a project intended to serve one airline (United) in a limited area. Eventually it was decided that it would serve all airlines through the entire airport, as well as handling incoming/outgoing and transfer baggage, serve multiple terminals, and integrate with airport software/hardware/sensors (which would be difficult even today). In conjunction with a lack of testing, the scope creep resulted in a failed project which cost hundreds of millions.
